

tyrosine at the Thr-X-Tyr segment in the activation loop.

MAPKs phosphorylate various substrates including
transcription factors, which in turn regulate the
expression of specific sets of genes and thus mediate a
5 specific response to the stimulus.

One particularly interesting kinase family are the c-Jun NH₂-terminal protein kinases, also known as JNKs. Three distinct genes, JNK1, JNK2, JNK3 have been identified and at least ten different splicing isoforms of JNKs exist in mammalian cells [Gupta et al., EMBO J., 15:2760-70 (1996)]. Members of the JNK family are activated by proinflammatory cytokines, such as tumor necrosis factor-α (TNFα) and interleukin-1 β (IL-1β), as

well as by environmental stress, including anisomycin, UV

15 irradiation, hypoxia, and osmotic shock [Minden et al., Biochemica et Biophysica Acta, 1333:F85-F104 (1997)].

The down-stream substrates of JNKs include transcription factors c-Jun, ATF-2, Elk1, p53 and a cell death domain protein (DENN) [Zhang et al. <u>Proc. Natl.</u>

- 20 <u>Acad. Sci. USA</u>, 95:2586-91 (1998)]. Each JNK isoform binds to these substrates with different affinities, suggesting a regulation of signaling pathways by substrate specificity of different JNKs in vivo (Gupta et al., supra).
- JNKs, along with other MAPKs, have been implicated in having a role in mediating cellular response to cancer, thrombin-induced platelet aggregation, immunodeficiency disorders, autoimmune diseases, cell death, allergies, osteoporosis and heart disease. The therapeutic targets related to activation of the JNK
- 30 therapeutic targets related to activation of the JNK pathway include chronic myelogenous leukemia (CML),

rheumatoid arthritis, asthma, osteoarthritis, ischemia, cancer and neurodeqenerative diseases.

Several reports have detailed the importance of JNK activation associated with liver disease or episodes 5 of hepatic ischemia [Nat. Genet. 21:326-9 (1999); FEBS Lett. 420:201-4 (1997); J. Clin. Invest. 102:1942-50 (1998); Hepatology 28:1022-30 (1998)]. Therefore, inhibitors of JNK may be useful to treat various hepatic disorders.

- A role for JNK in cardiovascular disease such as myocardial infarction or congestive heart failure has also been reported as it has been shown JNK mediates hypertrophic responses to various forms of cardiac stress [Circ. Res. 83:167-78 (1998); Circulation 97:1731-7
- 15 (1998); J. Biol. Chem. 272:28050-6 (1997); Circ. Res.
 79:162-73 (1996); Circ. Res. 78:947-53 (1996); J. Clin.
 Invest. 97:508-14 (1996)].

It has been demonstrated that the JNK cascade also plays a role in T-cell activation, including
20 activation of the IL-2 promoter. Thus, inhibitors of JNK may have therapeutic value in altering pathologic immune responses [J. Immunol. 162:3176-87 (1999); Eur. J.

Immunol. 28:3867-77 (1998); J. Exp. Med. 186:941-53 (1997); Eur. J. Immunol. 26:989-94 (1996)].

A role for JNK activation in various cancers has also been established, suggesting the potential use of JNK inhibitors in cancer. For example, constitutively activated JNK is associated with HTLV-1 mediated tumorigenesis [Oncogene 13:135-42 (1996)]. JNK may play a role in Kaposi's sarcoma (KS) because it is thought that the proliferative effects of bFGF and OSM on KS cells are mediated by their activation of the JNK signaling pathway

[J. Clin. Invest. 99:1798-804 (1997)]. Other proliferative effects of other cytokines implicated in KS proliferation, such as vascular endothelial growth factor (VEGF), IL-6 and TNFα, may also be mediated by JNK. In 5 addition, regulation of the c-jun gene in p210 BCR-ABL transformed cells corresponds with activity of JNK, suggesting a role for JNK inhibitors in the treatment for chronic myelogenous leukemia (CML) [Blood 92:2450-60 (1998)].

JNK1 and JNK2 are widely expressed in a variety

10

of tissues. In contrast, JNK3, is selectively expressed in the brain and to a lesser extent in the heart and testis [Gupta et al., supra; Mohit et al., Neuron 14:67-78 (1995); Martin et al., Brain Res. Mol. Brain Res. 35:47-57 (1996)]. JNK3 has been linked to neuronal apoptosis induced by kainic acid, indicating a role of JNK in the pathogenesis of glutamate neurotoxicity. In the adult human brain, JNK3 expression is localized to a subpopulation of pyramidal neurons in the CA1, CA4 and 20 subiculum regions of the hippocampus and layers 3 and 5 of the neocortex [Mohit et al., supra]. The CA1 neurons of

staining of the hippocampal neurons from brain tissues of 25 normal patients [Zhang et al., *supra*]. Thus, JNK3 appears to be involved involved in hypoxic and ischemic damage of CA1 neurons in the hippocampus.

patients with acute hypoxia showed strong nuclear JNK3immunoreactivity compared to minimal, diffuse cytoplasmic

In addition, JNK3 co-localizes immunochemically with neurons vulnerable in Alzheimer's disease [Mohit et 30 al., supra]. Disruption of the JNK3 gene caused resistance of mice to the excitotoxic glutamate receptor agonist kainic acid, including the effects on seizure

activity, AP-1 transcriptional activity and apoptosis of hippocampal neurons, indicating that the JNK3 signaling pathway is a critical component in the pathogenesis of glutamate neurotoxicity (Yang et al., Nature, 389:865-870 (1997)].

Based on these findings, JNK signalling, especially that of JNK3, has been implicated in the areas of apoptosis-driven neurodegenerative diseases such as Alzheimer's Disease, Parkinson's Disease, ALS (Amyotrophic Lateral Sclerosis), epilepsy and seizures, Huntington's Disease, traumatic brain injuries, as well as ischemic and hemorrhaging stroke.

There is a high unmet medical need to develop
JNK specific inhibitors that are useful in treating the
15 various conditions associated with JNK activation,
especially considering the currently available, relatively
inadequate treatment options for the majority of these
conditions

Recently, we have described crystallizable

20 complexes of JNK protein and adenosine monophosphate,
including complexes comprising JNK3, in U.S. Provisional
Application 60/084056, filed May 4, 1998. Such
information has been extremely useful in identifying and
designing potential inhibitors of various members of the

25 JNK family, which, in turn, have the described above
therapeutic utility.

Much work has been done to identify and develop drugs that inhibit MAPKs, such as p38 inhibitors. See, e.g., WO 98/27098 and WO 95/31451. However, to our 30 knowledge, no MAPK inhibitors have been shown to be specifically selective for JNKs versus other related MAPKs.

Accordingly, there is still a great need to develop potent inhibitors of JNKs, including JNK3 inhibitors, that are useful in treating various conditions associated with JNK activation.

5

SUMMARY OF THE INVENTION

The present invention addresses this problem by providing compounds that demonstrate strong inhibition of 10 JNK.

These compounds have the general formula:

(Formula I

or pharmaceutically acceptable derivatives or prodrugs thereof.

15

Y is selected from O, NH, N(R), S, S(O) or $S(O)_2$. X is selected from O, NH, or N(R).

 $$\rm R^1$ and $\rm R^2$ are each independently selected from H, a $\rm C_1\text{--}C_6$ straight chain or branched alkyl or alkenyl group, optionally substituted with one to four substituents, each

20 of which is independently selected from NH₂, NHR, N(R)₂,
NO₂, OH, OR, CF₃, halo, CN, CO₂H, CONH₂, CONHR, CON(R)₂,
COR, SR, S(O)R, S(O)₂R, S(O)₂NH₂, S(O)₂NHR or R; a 5-7
membered aromatic or non-aromatic carbocyclic or

heterocyclic ring, optionally substituted with one to four 25 substituents, each of which is independently selected from

NH₂, NHR, N(R)₂, NO₂, OH, OR, CF₃, halo, CN, CO₂H, CONH₂, CONHR, CON(R)₂, COR, SR, S(O)R, S(O)₂R, S(O)₂NH₂, S(O)₂NHR or R; or a 9-10 membered bicyclic aromatic or non-aromatic carbocyclic or heterocyclic ring optionally substituted

with one to four substituents, each of which is independently selected from NH₂, NHR, N(R)₂, NO₂, OH, OR, CF₃, halo, CN, CO₂H, CONH₂, CONHR, CON(R)₂, COR, SR, S(O)R, S(O)₂R, S(O)₂NH₂, S(O)₂NHR or R.

R is a C_1 - C_6 straight chain or branched alkyl or alkenyl group, a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring, or a 9-10 membered bicyclic aromatic or non-aromatic carbocyclic or heterocyclic ring system.

In another embodiment, the invention provides pharmaceutical compositions comprising the JNK inhibitors of this invention. These compositions may be utilized in methods for treating or preventing a variety of disorders, such as heart disease, immunodeficiency disorders,

15 inflammatory diseases, allergic diseases, autoimmune diseases, destructive bone disorders such as osteoporosis, proliferative disorders, infectious diseases and viral diseases. These compositions are also useful in methods for preventing cell death and hyperplasia and therefore

20 may be used to treat or prevent reperfusion/ischemia in stroke, heart attacks, and organ hypoxia. The compositions are also useful in methods for preventing thrombin-induced platelet aggregation. The compositions are especially useful for disorders such as chronic

25 myelogenous leukemia (CML), rheumatoid arthritis, asthma, osteoarthritis, ischemia, cancer, liver disease including hepatic ischemia, heart disease such as myocardial infarction and congestive heart failure, pathologic immune conditions involving T cell activation and

30 neurodegenerative disorders. Each of these abovedescribed methods is also part of the present invention.

DETAILED DESCRIPTION OF THE INVENTION

The JNK inhibitors of the invention have the general formula:

$$0 \quad 0 \quad \\ \downarrow \\ 0 \quad N \quad Y \quad \\ \downarrow \\ 0 \quad N \quad P \quad \\ 0 \quad N \quad \\ 0 \quad N \quad \\ 0 \quad N \quad P \quad \\ 0 \quad N \quad \\ 0 \quad N$$

(Formula I

or pharmaceutically acceptable derivatives or prodrugs ${\sf 5}$ thereof.

Y is selected from O, NH, N(R), S, S(O) or $S(O)_2$. X is selected from O, NH or N(R).

 R^1 and R^2 are each independently selected from H, a $C_1\text{-}C_6$ straight chain or branched alkyl or alkenyl group,

- 10 optionally substituted with one to four substituents, each of which is independently selected from NH₂, NHR, N(R)₂, NO₂, OH, OR, CF₃, halo, CN, CO₂H, CONH₂, CONHR, CON(R)₂, COR, SR, S(O)_R, S(O)₂R, S(O)₂NH₂, S(O)₂NHR or R; a 5-7 membered aromatic or non-aromatic carbocyclic or
- 15 heterocyclic ring, optionally substituted with one to four substituents, each of which is independently selected from NH₂, NHR, N(R)₂, NO₂, OH, OR, CF₃, halo, CN, CO₂H, CONH₂, CONHR, CON(R)₂, COR, SR, S(O)_R, S(O)₂R, S(O)₂NH₂, S(O)₂NHR or R; or a 9-10 membered bicyclic aromatic or non-aromatic
- 20 carbocyclic or heterocyclic ring optionally substituted with one to four substituents, each of which is independently selected from NH₂, NHR, N(R)₂, NO₂, OH, OR, CF₃, halo, CN, CO₂H, CONH₂, CONHR, CON(R)₂, COR, SR, S(O)_R, S(O)₂R, S(O)₂NH₂, S(O)₂NHR or R.
- 25 R is a C_1 - C_6 straight chain or branched alkyl or alkenyl group, a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring, or a 9-10 membered

bicyclic aromatic or non-aromatic carbocyclic or heterocyclic ring system.

A heterocyclic ring system or a heterocyclic ring as defined herein is one that contains 1 to 4 5 heteroatoms, which are independently selected from N, O, S, SO and SO₂.

Some specific examples of preferred compounds of the instant invention are provided in Table 1 below. In Table 1, "+" represents a Ki \geq 1 μ M, "++" represents a Ki 10 < 1 μ M, and "ND" means not determined. The Ki is

determined by the method disclosed in Example 3.

According to another embodiment, the present invention provides methods of producing JNK inhibitors of Formula I. Synthesis schemes for these compounds are described in Examples 1 and 2.

- According to another embodiment of the invention, the activity of the JNK inhibitors of this invention may be assayed in vitro, in vivo or in a cell line. In vitro assays include assays that determine inhibition of either the kinase activity or ATPase
- 10 activity of activated JNK. For example, see Examples 3 to 5. Alternate in vitro assays quantitate the ability of the inhibitor to bind to JNK and may be measured either by radiolabelling the inhibitor prior to binding, isolating the inhibitor/JNK complex and determining the amount of
- 15 radiolabel bound, or by running a competition experiment where new inhibitors are incubated with JNK bound to known radioligands. One may use any type or isoform of JNK, depending upon which JNK type or isoform is to be inhibited.
- The JNK inhibitors or pharmaceutical salts
 thereof may be formulated into pharmaceutical compositions
 for administration to animals or humans. These
 pharmaceutical compositions, which comprise an amount of
 JNK inhibitor effective to treat or prevent a JNK-mediated
 25 condition and a pharmaceutically acceptable carrier, are
- 25 condition and a pharmaceutically acceptable carrier, are another embodiment of the present invention.

The term "JNK-mediated condition", as used herein means any disease or other deleterious condition in which JNK is known to play a role. Such conditions

30 include, without limitation, inflammatory diseases, autoimmune diseases, destructive bone disorders, proliferative disorders, cancer, infectious diseases, neurodegenerative diseases, allergies,
reperfusion/ischemia in stroke, heart attacks, angiogenic
disorders, organ hypoxia, vascular hyperplasia, cardiac
hypertrophy, thrombin-induced platelet aggregation, and
5 conditions associated with prostaglandin endoperoxidase
synthase-2.

Inflammatory diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, acute pancreatitis, chronic

10 pancreatitis, asthma, allergies, and adult respiratory distress syndrome.

Autoimmune diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, glomerulonephritis, rheumatoid

- 15 arthritis, systemic lupus erythematosus, scleroderma, chronic thyroiditis, Graves' disease, autoimmune gastritis, diabetes, autoimmune hemolytic anemia, autoimmune neutropenia, thrombocytopenia, atopic dermatitis, chronic active hepatitis, myasthenia gravis,
- 20 multiple sclerosis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, psoriasis, or graft vs. host disease.

Destructive bone disorders which may be treated or prevented by the compounds of this invention include,

25 but are not limited to, osteoporosis, osteoarthritis and multiple myeloma-related bone disorder.

Proliferative diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, acute myelogenous leukemia, chronic

30 myelogenous leukemia, metastatic melanoma, Kaposi's sarcoma, multiple myeloma and HTLV-1 mediated tumorigenesis. Angiogenic disorders which may be treated or prevented by the compounds of this invention include solid tumors, ocular neovasculization, infantile haemangiomas. Infectious diseases which may be treated or prevented by 5 the compounds of this invention include, but are not limited to, sepsis, septic shock, and Shigellosis.

Viral diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, acute hepatitis infection (including hepatitis 10 A, hepatitis B and hepatitis C), HIV infection and CMV

retinitis.

Neurodegenerative diseases which may be treated

or prevented by the compounds of this invention include, but are not limited to, Alzheimer's disease, Parkinson's 15 disease, amyotrophic lateral sclerosis (ALS), epilepsy, seizures, Huntington's disease, traumatic brain injury,

ischemic and hemorrhaging stroke, cerebral ischemias or neurodegenerative disease, including apoptosis-driven neurodegenerative disease, caused by traumatic injury,

20 acute hypoxia, ischemia or glutamate neurotoxicity.

"JNK-mediated conditions" also include ischemia/reperfusion in stroke, heart attacks, myocardial ischemia, organ hypoxia, vascular hyperplasia, cardiac hypertrophy, hepatic ischemia, liver disease, congestive

25 heart failure, pathologic immune responses such as that caused by T cell activation and thrombin-induced platelet aggregation.

In addition, JNK inhibitors of the instant invention may be capable of inhibiting the expression of 30 inducible pro-inflammatory proteins. Therefore, other "JNK-mediated conditions" which may be treated by the compounds of this invention include edema, analgesia,

fever and pain, such as neuromuscular pain, headache, cancer pain, dental pain and arthritis pain.

In addition to the compounds of this invention, pharmaceutically acceptable derivatives or prodrugs of the 5 compounds of this invention may also be employed in compositions to treat or prevent the above-identified disorders.

A "pharmaceutically acceptable derivative or prodrug" means any pharmaceutically acceptable salt,

- 10 ester, salt of an ester or other derivative of a compound of this invention which, upon administration to a recipient, is capable of providing, either directly or indirectly, a compound of this invention or an inhibitorily active metabolite or residue thereof.
- 15 Particularly favored derivatives or prodrugs are those that increase the bioavailability of the compounds of this invention when such compounds are administered to a mammal (e.g., by allowing an orally administered compound to be more readily absorbed into the blood) or which enhance
- 20 delivery of the parent compound to a biological compartment (e.g., the brain or lymphatic system) relative to the parent species.

Pharmaceutically acceptable prodrugs of the compounds of this invention include, without limitation, 25 esters, amino acid esters, phosphate esters, metal salts and sulfonate esters.

Pharmaceutically acceptable salts of the compounds of this invention include those derived from pharmaceutically acceptable inorganic and organic acids 30 and bases. Examples of suitable acid salts include acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate,

camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptanoate, glycerophosphate, glycolate, hemisulfate, heptanoate, hexanoate, hydrochloride.

- 5 hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oxalate, palmoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, salicylate.
- 10 succinate, sulfate, tartrate, thiocyanate, tosylate and undecanoate. Other acids, such as oxalic, while not in themselves pharmaceutically acceptable, may be employed in the preparation of salts useful as intermediates in obtaining the compounds of the invention and their
- 15 pharmaceutically acceptable acid addition salts. Salts derived from appropriate bases include alkali metal (e.g., sodium and potassium), alkaline earth metal (e.g., magnesium), ammonium and N-(C_{1-4} alkyl)4 $^{\circ}$ salts. This invention also envisions the quaternization of any basic
- 20 nitrogen-containing groups of the compounds disclosed herein. Water or oil-soluble or dispersible products may be obtained by such quaternization.

Pharmaceutically acceptable carriers that may be used in these pharmaceutical compositions include, but are 25 not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or 30 electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride,

zinc salts, colloidal silica, magnesium trisilicate,

polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, waxes, polyethylene-polyoxypropylene-block polymers, polyethylene glycol and wool fat.

- The compositions of the present invention may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir. The term "parenteral" as used herein includes subcutaneous, intravenous, intramuscular,
- 10 intra-articular, intra-synovial, intrasternal, intrathecal, intrahepatic, intralesional and intracranial injection or infusion techniques. Preferably, the compositions are administered orally, intraperitoneally or intravenously.
- 15 Sterile injectable forms of the compositions of this invention may be aqueous or oleaginous suspension. These suspensions may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile
- 20 injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterallyacceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution
- 25 and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its
- 30 glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their

polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as carboxymethyl cellulose or similar dispersing agents which are commonly used in the

- 5 formulation of pharmaceutically acceptable dosage forms including emulsions and suspensions. Other commonly used surfactants, such as Tweens, Spans and other emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable
- 10 solid, liquid, or other dosage forms may also be used for the purposes of formulation.

The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to,

- 15 capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include
- 20 lactose and dried cornstarch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added.
- 25 Alternatively, the pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These can be prepared by mixing the agent with a suitable non-irritating excipient which is solid at room temperature 30 but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of this invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including 5 diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared for each of these areas or organs.

Topical application for the lower intestinal tract can be effected in a rectal suppository formulation 10 (see above) or in a suitable enema formulation.

Topically-transdermal patches may also be used.

For topical applications, the pharmaceutical

compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in 15 one or more carriers. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water.

20 Alternatively, the pharmaceutical compositions can be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan

25 monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspensions in isotonic, pH adjusted sterile saline, or, preferably, 30 as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic

uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

The pharmaceutical compositions of this invention may also be administered by nasal aerosol or 5 inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability,

10 fluorocarbons, and/or other conventional solubilizing or dispersing agents.

The amount of JNK inhibitor that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated, the particular

15 mode of administration. Preferably, the compositions should be formulated so that a dosage of between 0.01 - 100 mg/kg body weight/day of the inhibitor can be administered to a patient receiving these compositions.

It should also be understood that a specific

20 dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of

25 the treating physician and the severity of the particular disease being treated. The amount of inhibitor will also depend upon the particular compound in the composition.

According to another embodiment, the invention provides methods for treating or preventing a JNK-mediated 30 condition comprising the step of administering to a patient one of the above-described pharmaceutical

compositions. The term "patient", as used herein, means an animal, preferably a human.

Preferably, that method is used to treat or prevent a condition selected from inflammatory diseases, 5 autoimmune diseases, destructive bone disorders, proliferative disorders, infectious diseases, degenerative diseases, neurodegenerative diseases, allergies, reperfusion/ischemia in stroke, heart attacks, angiogenic disorders, organ hypoxia, vascular hyperplasia, cardiac 10 hypertrophy, and thrombin-induced platelet aggregation, or

Depending upon the particular JNK-mediated condition to be treated or prevented, additional drugs, which are normally administered to treat or prevent that 15 condition, may be administered together with the inhibitors of this invention. For example, chemotherapeutic agents or other anti-proliferative agents may be combined with the JNK inhibitors of this invention to treat proliferative diseases.

any specific disease or disorder described above.

Those additional agents may be administered separately, as part of a multiple dosage regimen, from the JNK inhibitor-containing composition. Alternatively, those agents may be part of a single dosage form, mixed together with the JNK inhibitor in a single composition.

In order that the invention described herein may be more fully understood, the following examples are set forth. It should be understood that these examples are for illustrative purposes only and are not to be construed as limiting this invention in any manner.

-22-

The general synthesis of compounds of Formula I

5 wherein X and Y are amino groups is shown above. Compound

C may be prepared as described by Tominaga, S. et al., J.

Heterocyclic Chem., 28:1039-1042 (1991), or as described

below in Example 2. In the general scheme, compound C is

subsequently oxidized to the sulphone derivative D

10 utilizing an oxidant such as meta-chloro-perbenzoic acid

(mCPBA) or other oxidants known in the art. The

intermediate D is then contacted with an amine to displace
the sulphone moiety, thereby affording compounds of type

E. Compound E is then contacted with a second amine to 15 displace the methyl ester, thereby forming amides of type ${f F}.$ Specific examples of type ${f F}$ compounds are described in Example 2. Alternatively, compound ${f E}$ may be saponified by contacting with a base such as sodium hydroxide, or lithium hydroxide to form an acid derivative. Such acid 5 derivative could be coupled to various R_1NH_2 amines utilizing any one of numerous conditions known in the art to generate compounds of type ${f F}.$

ArNH₂

$$NMP, 160^{\circ}C$$

$$NHP$$

$$N$$

In a preferred embodiment of the general synthesis scheme outlined in Example 1, 20.1 g (137 mmol) 15 dimethyl N-cyanodithioiminocarbonate (A) and 38.4 g (278 mmol) potassium carbonate (K₂CO₃) were dissolved in 180 mL dimethyl sulfoxide (DMSO). 23.5 mL (206 mmol) dimethylmalonate (CH₂CO₂Me) was added to the mixture. The reaction was stirred at room temperature for 6 hours (h),

20 then poured into ice-cold aqueous 1.7M HCl. The solid precipitate was filtered, washed with water (500 mL) and dried. 2-(Methylsulfanyl-ureido-methylene)-malonic acid dimethyl ester (B) was purified by thin layer chromatography (TLC) [Rf 0.45 (9:1 $CH_2C_{12}:MeOH)$]. The yield of B was 60%.

To prepare 6-methylsulfanyl-2,4-dioxo-1,2,3,4-5 tetrahydro-pyrimidine-5-carboxylic acid methyl ester (C), 24.55 g (98.9 mmol) compound B was suspended in 500 mL methanol (MeOH), and 22 mL (158 mmol) triethylamine (Et₃N) was added. The mixture was heated to reflux for 2 h. The solution was rotary evaporated to a viscous syrup, and 10 methanol (~50 mL) and 3M HCl were added. The mixture was

10 methanol (~50 mL) and 3M HCl were added. The mixture was cooled and the solid was isolated by filtration. The product was washed with water (600 mL) and dried. The yield of C was 22.11 g.

5.39 g (24.9 mmol) C and 26.3 g m-chloro-

- 15 peroxybenzoic acid (mCPBA) were heated to reflux in 150 mL benzene for 2 h. The solvent was then removed by rotary evaporation and the residue suspended in 70 mL ethyl acetate. The suspension was mixed for 40 minutes at room temperature, then filtered. The isolated solid was
- 20 resuspended in 40 mL ethyl acetate, mixed for 40 minutes at room temperature, then filtered. The yield of 6-methanesulfonyl-2,4-dioxo-1,2,3,4-tetrahydro-pyrimidine-5-carboxylic acid methyl ester (D) was 53% (3.29 g).

To prepare 2,4-Dioxo-6-phenylamino-1,2,3,4-

- 25 tetrahydro-pyrimidine-5-carboxylic acid methyl ester (E), 214 mg (0.86 mmol) D was dissolved in 3 mL dimethyl formamide (DMF). 100 µL (1.1 mmol) aniline was added and the reaction stirred at room temperature for 6 h. The reaction was cooled to room temperature and the
- 30 precipitate was filtered, washed with approximately 1.5 mL DMF and 5 mL diethyl ether, then dried. The yield of E was 86 mg (38%).

Compound E was synthesized from D as described above in Example 1. 21.7 mg (83 μ C) E was added to 250 μ C N-methyl pyrrolidinone (NMP) and 106 mg (1.13 mmol) 2-aminopyridine. The reaction was heated at 160°C for 5 h,

5 then cooled. 3 mL 3M HCl was added to the cool mixture and the solution of the crude product 2,4-Dioxo-6-phenylamino-1,2,3,4-tetrahydro-pyrimidine-5-carboxylic acid pyridin-2-ylamide (2) was directly purified by preparative HPLC.

To prepare 2,4-dioxo-6-phenylamino-1,2,3,4-

- 10 tetrahydro-pyrimidine-5-carboxylic acid (4-fluoro-phenyl)amide (3), 250 μL NMP and 250 μL 4-fluoroaniline was added to 22.8 mg (87 μmol) E. The reaction was heated at 160°C for 5 h, then cooled. 5 mL 3M HCl was added to the cool mixture and the precipitate was isolated by filtration.
- 15 The crude product of 3 was dissolved in aqueous acetonitrile and purified by preparative HPLC.

EXAMPLE 3

Cloning, Expression and Purification of JNK3 Protein

- A BLAST search of the EST database using the published JNK3α1 cDNA as a query identified an EST clone (#632588) that contained the entire coding sequence for human JNK3α1. Polymerase chain reactions (PCR) using pfu polymerase (Strategene) were used to introduce restriction
- 25 sites into the cDNA for cloning into the pET-15B expression vector at the NcoI and BamHI sites. The protein was expressed in *E. coli*. Due to the poor solubility of the expressed full-length protein (Met 1-Gln 422), an N-terminally truncated protein starting at Ser
- 30 residue at position 40 (Ser 40) was produced. This truncation corresponds to Ser 2 of JNK1 and JNK2 proteins, and is preceded by a methionine (initiation) and a glycine

residue. The glycine residue was added in order to introduce an NcoI site for cloning into the expression vector. In addition, systematic C-terminal truncations were performed by PCR to identify a construct that give 5 rise to diffraction-quality crystals. One such construct encodes amino acid residues Ser40-Glu402 of JNK3 α 1 and is

The construct was prepared by PCR using deoxyoligonucleotides

preceded by Met and Glv residues.

5' GCTCTAGAGCTCCATGGGCAGCAAAAGCAAAGTTGACAA 3' (forward primer with initiation codon underlined) and 5' TAGCGGATCCTCATTCTGAATTCATTACTTCCTTGTA 3' (reverse primer with stop codon underlined)

as primers and was confirmed by DNA sequencing. Control
15 experiments indicated that the truncated JNK3 protein had
an equivalent kinase activity towards myelin basic protein
when activated with an upstream kinase MKK7 in vitro.

E.coli strain BL21 (DE3) (Novagen) was transformed with the JNK3 expression construct and grown 20 at 30°C in LB supplemented with 100 μ g/ml carbenicillin in shaker flasks until the cells were in log phase (OD₆₀₀ ~ 0.8). Isopropylthio- β -D-galactosidase (IPTG) was added to a final concentration of 0.8 mM and the cells were harvested 2 hours later by centrifugation.

- E. coli cell paste containing JNK3 was resuspended in 10 volumes/g lysis buffer (50 mM HEPES, pH 7.2, containing 10% glycerol (v/v), 100 mM NaCl, 2 mM DTT, 0.1 mM PMSF, 2 μg/ml Pepstatin, 1μg/ml each of E-64 and Leupeptin). Cells were lysed on ice using a
- 30 microfluidizer and centrifuged at 100,000 x g for 30 min at 4 °C. The 100,000 x g supernatant was diluted 1:5 with Buffer A (20 mM HEPES, pH 7.0, 10% glycerol (v/v), 2 mM

DTT) and purified by SP-Sepharose (Pharmacia) cation-exchange chromatography (column dimensions: 2.6 x 20 cm) at 4 °C. The resin was washed with 5 column volumes of Buffer A, followed by 5 column volumes of Buffer A 5 containing 50 mM NaCl. Bound JNK3 was eluted with a 7.5 column volume linear gradient of 50-300 mM NaCl. JNK3 eluted between 150-200 mM NaCl.

EXAMPLE 4

10

Activation of JNK3

5 mg of JNK3 was diluted to 0.5 mg/ml in 50 mM HEPES buffer, pH 7.5, containing 100 mM NaCl, 5 mM DTT, 20 mM MgCl $_2$ and 1 mM ATP. GST-MKK7(DD) was added at a molar ratio of 1:2.5 GST-MKK7:JNK3. After incubation for 30

- 15 minutes at 25°C, the reaction mixture was concentrated 5fold by ultrafiltration in a Centriprep-30 (Amicon,
 Beverly, MA), diluted to 10 ml and an additional 1 mM ATP
 added. This procedure was repeated three times to remove
 ADP and replenish ATP. The final addition of ATP was 5 mM
- 20 and the mixture incubated overnight at 4°C .

The activated JNK3/GST-MKK7(DD) reaction mixture was exchanged into 50 mM HEPES buffer, pH 7.5, containing 5 mM DTT and 5% glycerol (w/v) by dialysis or ultrafiltration. The reaction mixture was adjusted to 1.1

- 25 M potassium phosphate, pH 7.5, and purified by hydrophobic interaction chromatography (at 25 °C) using a Rainin Hydropore column. GST-MKK7 and unactivated JNK3 do not bind under these conditions such that when a 1.1 to 0.05 M potassium phosphate gradient is developed over 60 minutes
- 30 at a flow rate of 1 ml/minute, doubly phosphorylated JNK3 is separated from singly phosphorylated JNK. Activated

-28-

JNK3 (i.e. doubly phosphorylated JNK3) was stored at -70° C at 0.25-1 mg/ml.

EXAMPLE 5

5 JNK Inhibition Assays

Compounds were assayed for the inhibition of JNK3 by a spectrophotometric coupled-enzyme assay. In this assay, a fixed concentration of activated JNK3 (10 nM) was incubated with various concentrations of a 10 potential inhibitor dissolved in DMSO for 10 minutes at 30°C in a buffer containing 0.1 M HEPES buffer, pH 7.5, containing 10 mM MgCl₂, 2.5 mM phosphoenolpyruvate, 200 µM NADH, 150 µg/mL pyruvate kinase, 50 µg/mL lactate dehydrogenase, and 200 µM EGF receptor peptide. The EGF 15 receptor peptide has the sequence KRELVEPLTPSGEAPNQALLR, and is a phosphoryl acceptor in the JNK3-catalyzed kinase reaction. The reaction was initiated by the addition of 10 µM ATP and the assay plate is inserted into the spectrophotometer's assay plate compartment that was 20 maintained at 30°C. The decrease of absorbance at 340 nm

was monitored as a function of time. The rate data as a function of inhibitor concentration was fitted to competitive inhibition kinetic model to determine the K.
